

Summary of JavaScript Image Swapping

This document explains how to swap images in JavaScript using inline event handling, extending Chapter 47:

1. **Basic Image Swap:** An inline handler swaps a "before" image with an "after" image on mouseover (e.g., ``, setting the source via `document.getElementById("before").src = "after-pic.j`
3. **General-Purpose Function:** A flexible `swapPic(id, newPic)` function swaps any image, using `` and `document.getElementById(id).src = newPic`.
4. **Advantages:** The general-purpose function is reusable, accepting element ID and new image source as arguments.
5. **Context:** Inline event handling is used for simplicity, with professional methods to be covered later.
