JavaScript Alerts Notes

Overview

- **Alerts**: Pop-up message boxes in JavaScript to display messages to users.

- Example: `alert("Thanks for your input!");`

Syntax Rules

- **Keyword**: Use `alert` (lowercase, case-sensitive).

- **Text String**: Enclose message in double quotes (`" "`).

- **Parentheses**: Required, no spaces before/after (`alert("message");`).

- **Semicolon**: End every statement with `;` (unless using `{}`).

Coding Style

- **No spaces** around parentheses for clean code.

- Use **double quotes** (`" "`) for strings, not single quotes (`' '`).

- Always include a **semicolon** to end statements for consistency.

Alternatives

- `window.alert("message");` is formal but equivalent to `alert("message");`.
    - Prefer the shorter `alert` for simplicity.
- Single quotes (`' '`) are valid but use double quotes for consistency.
